

NEWDAWN G.A.I.G.S.

Social media gave us a voice. GAIGS builds the power to act.

A people-owned operating system for local action, work,
governance and verifiable public benefit.

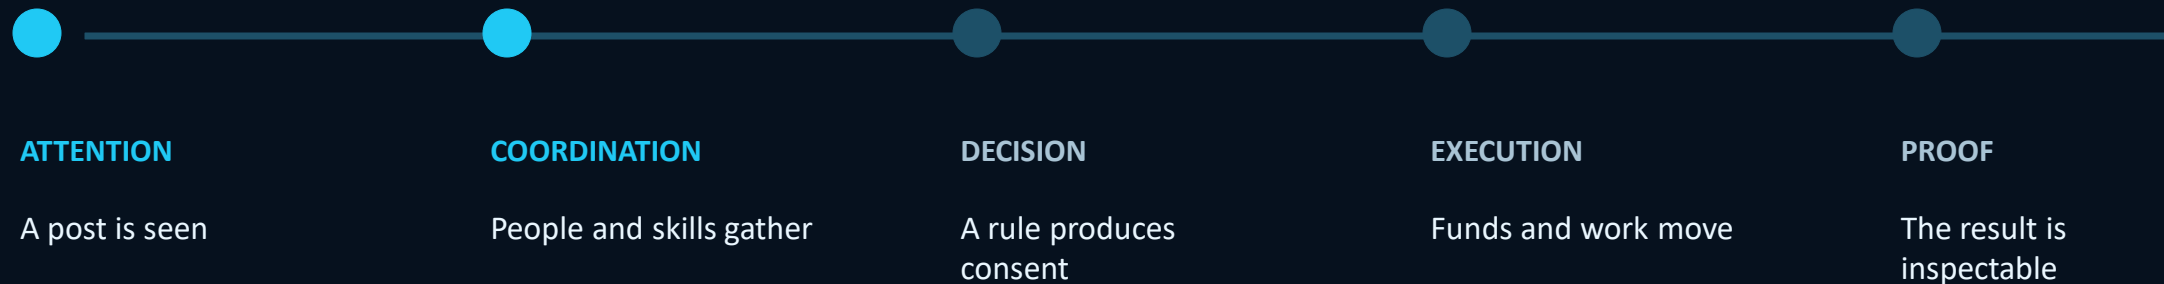

INVESTOR BRIEF · MVP RELEASE 2.4.1

Identity → Community → Decision → Funding → Proof

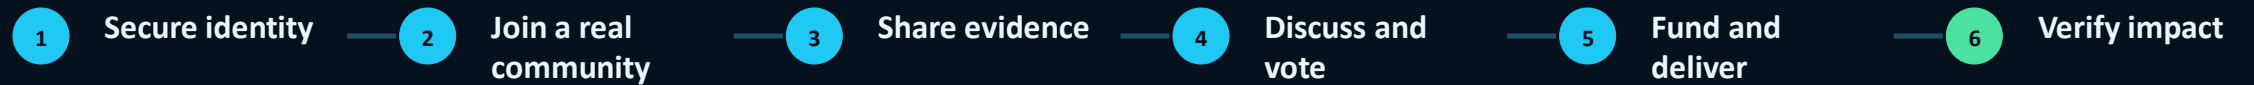

The gap is not voice. It is execution.

People already publish needs, discover work, raise money and debate decisions—across disconnected systems that lose context between the problem and the proof.

GAIGS connects the entire chain—and records where the chain is still incomplete.

One loop turns a local need into a verified result.

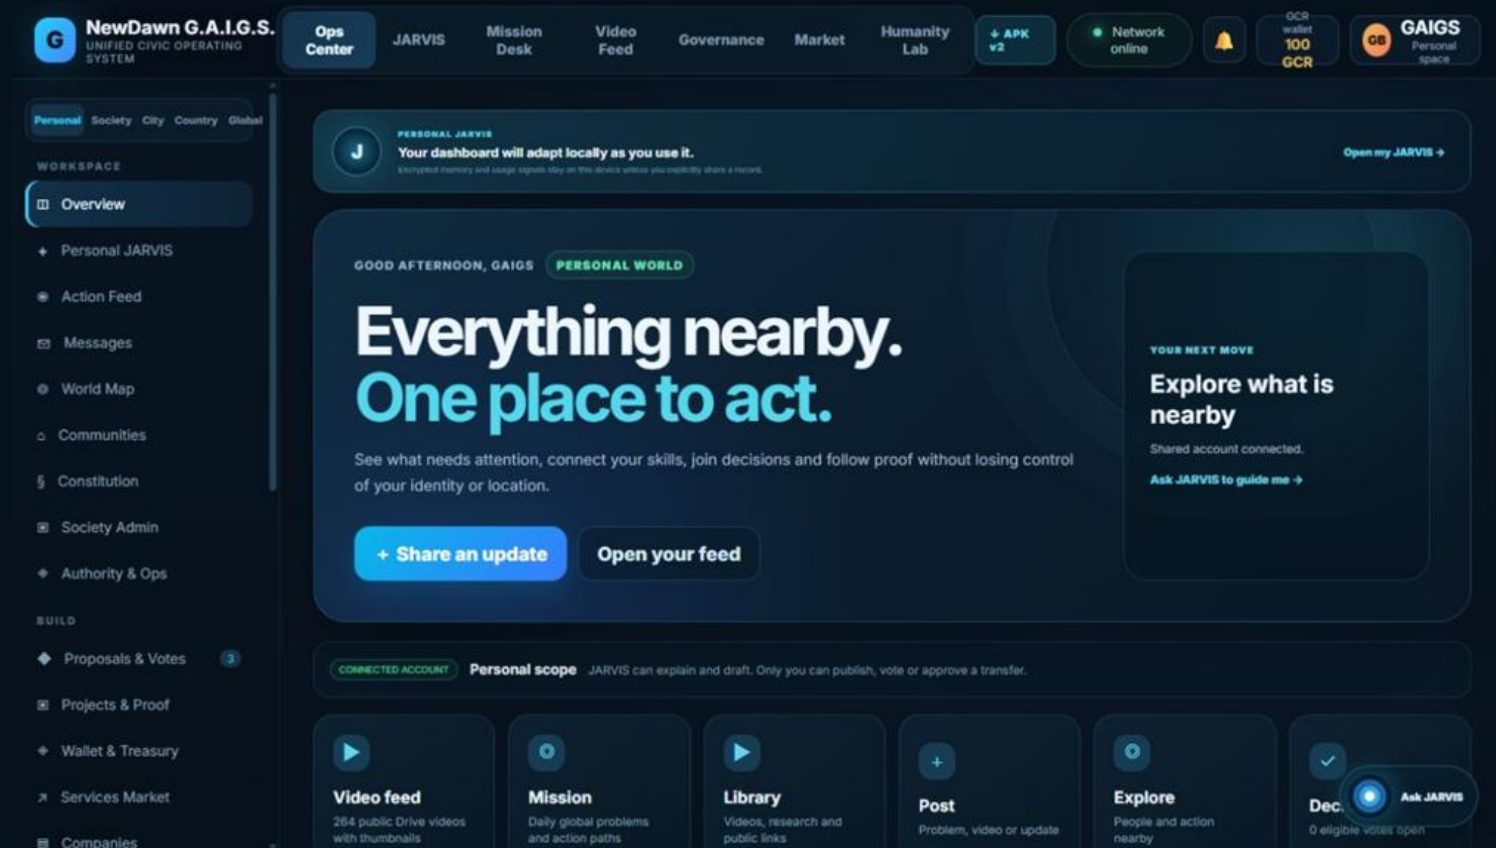

JARVIS assists across the loop, while publication, voting and transfers remain human-approved.

North-star metric

Verified Actions Completed

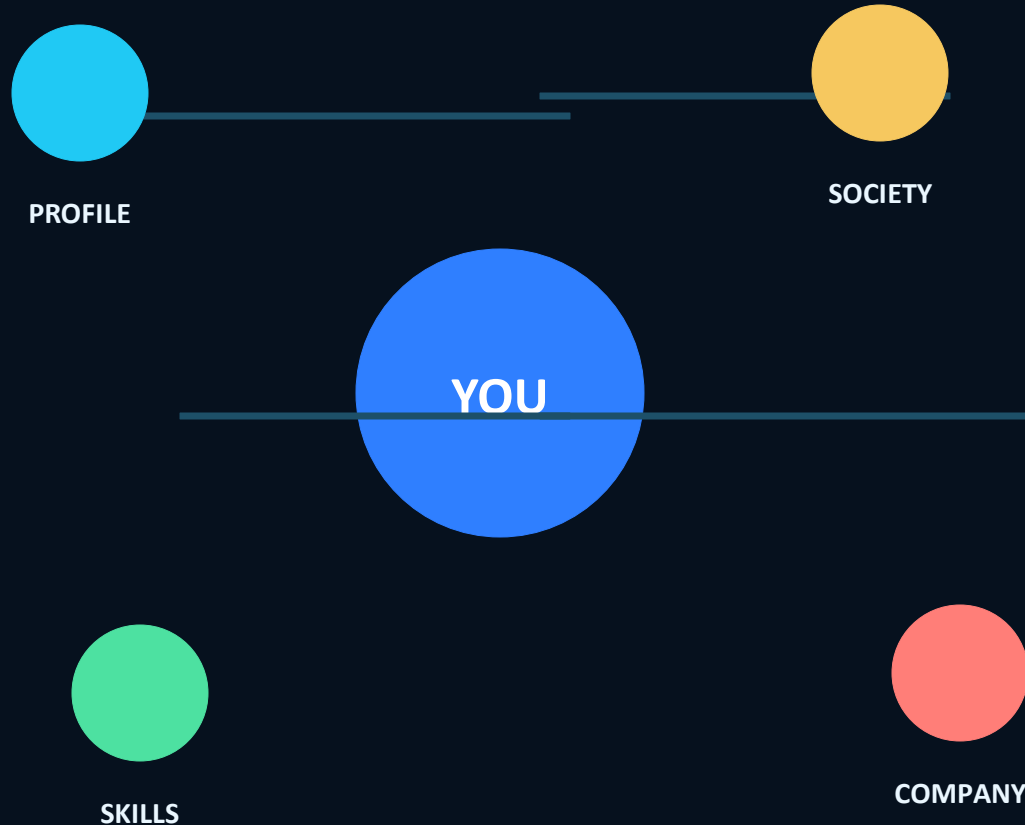

The working MVP already carries the full product shape.

LIVE NOW

- Account registration + login
- Dedicated GCR wallet
- Media posts + rewards
- Proposals, votes + project wallet
- Public web + installable Android preview

One identity can serve personal, professional and civic life.

Location narrows discovery without making exact coordinates public by default.

Nearby communities

Local services and work

City and country missions

Global collaboration when invited

Governance is a transparent workflow, not a permanent ruler.

Administrator

A clerk with bounded permissions: verifies process, publishes records and can be replaced by member rules.

Member sovereignty

Members can inspect evidence, vote, see fund movements and challenge missing proof within their scope.

Accountability starts before a public blockchain.

USER WALLET

Closed-loop GCR credits

PROJECT WALLET

Funds tied to one approved plan

LEDGER RECEIPTS

Hash-linked records detect tampering

PUBLIC ANCHOR

Planned after audit and regulation

GCR is currently a platform credit—not money, a bank account or a tradable crypto asset.

JARVIS is useful because it is bounded by human approval.

EXPLAINS

rules, evidence and options

DRAFTS

posts, proposals and plans

NAVIGATES

the relevant workspace

REMEMBERS

approved device preferences

Never autonomous

People publish, vote and approve transfers.

Local work can become the fastest path to daily utility.

A resident posts a need

JARVIS ranks nearby matches

Provider completes verified work

Tailoring · food · transport · repair · tutoring · digital freelance · company pages

Trust loop

**Identity + proximity + evidence + outcome +
reputation**

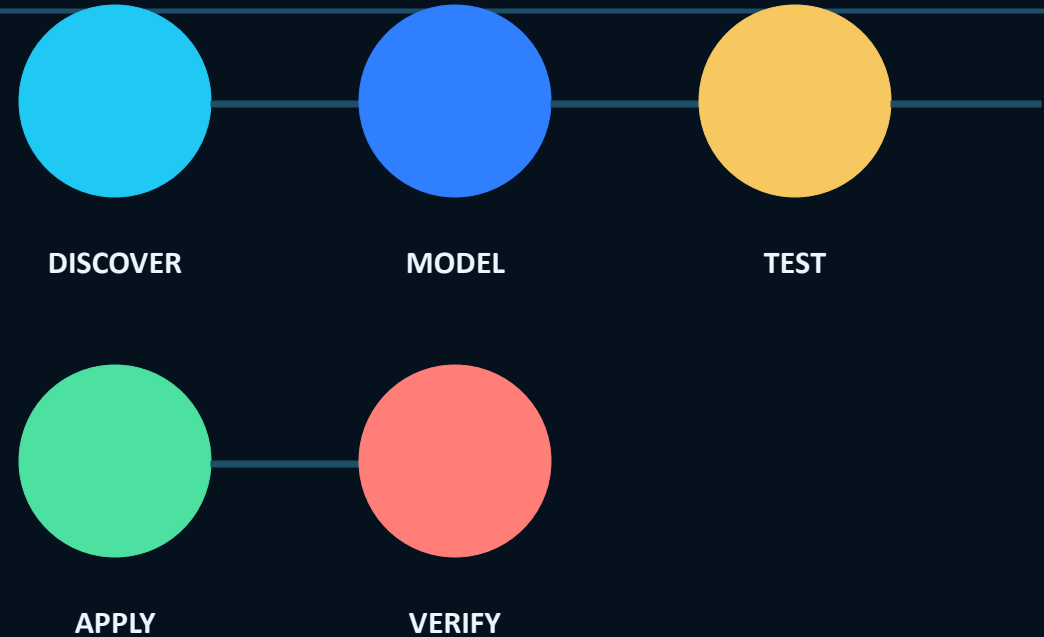

Emergencies need coordination without invented certainty.

- | | | |
|----|----------------|--|
| 01 | SIGNAL | A public alert or member report |
| 02 | VERIFY | Source, time, place and evidence |
| 03 | MISSION | Needs, skills and response owners |
| 04 | FUND | A dedicated transparent project wallet |
| 05 | PROOF | Delivery evidence and public receipt |

Humanity Lab turns unsolved problems into collaborative missions.

Not a game layered on top of reality.

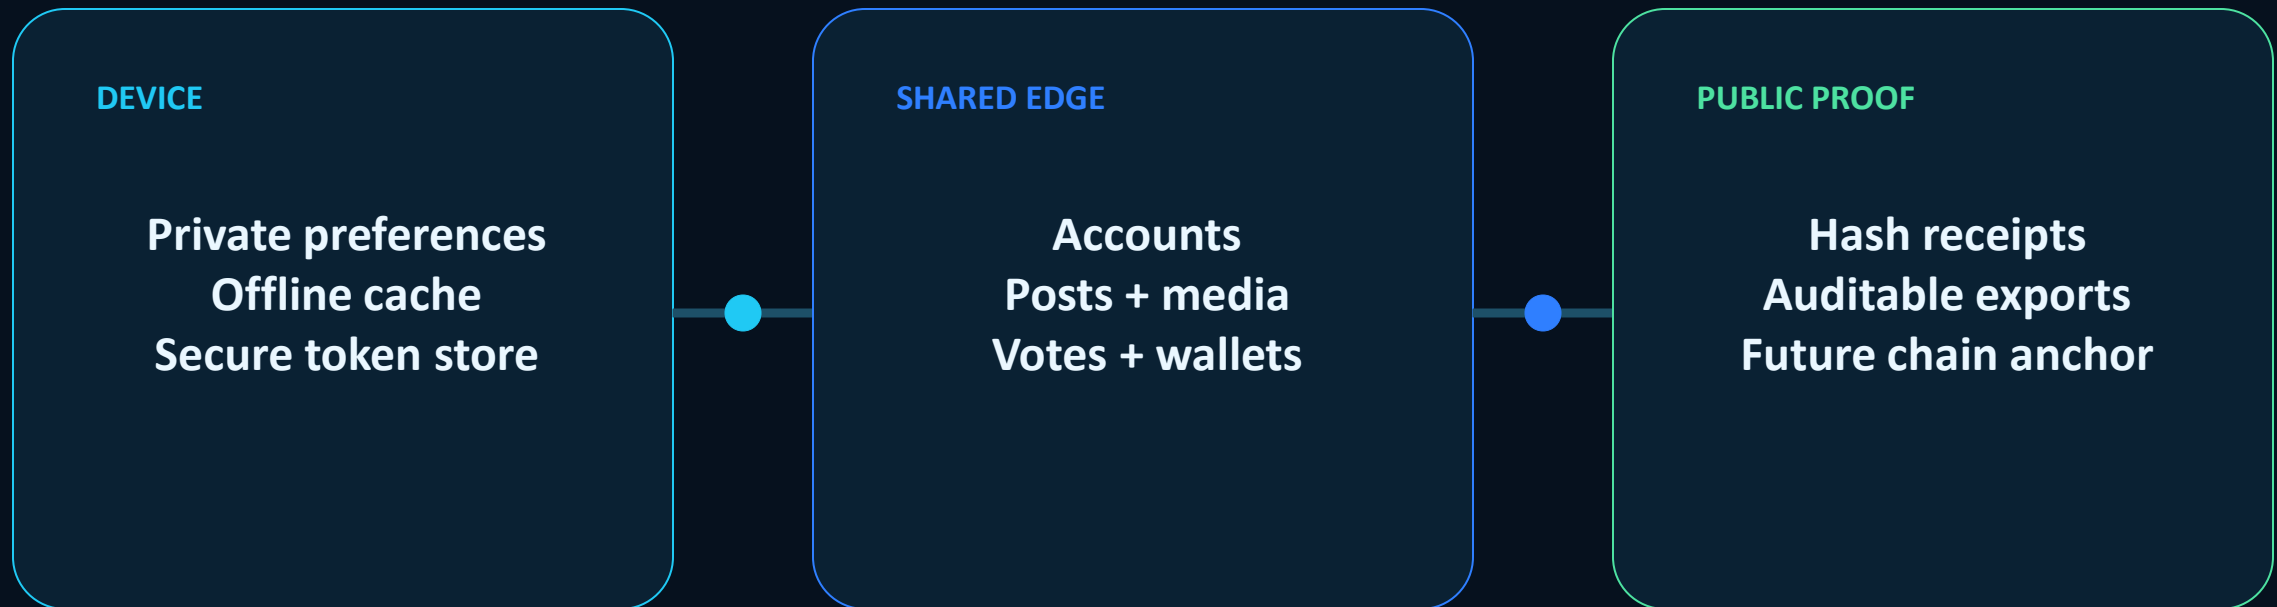

A mission system where scientific puzzles, community problems and field verification generate reputation for useful contribution.

ROADMAP

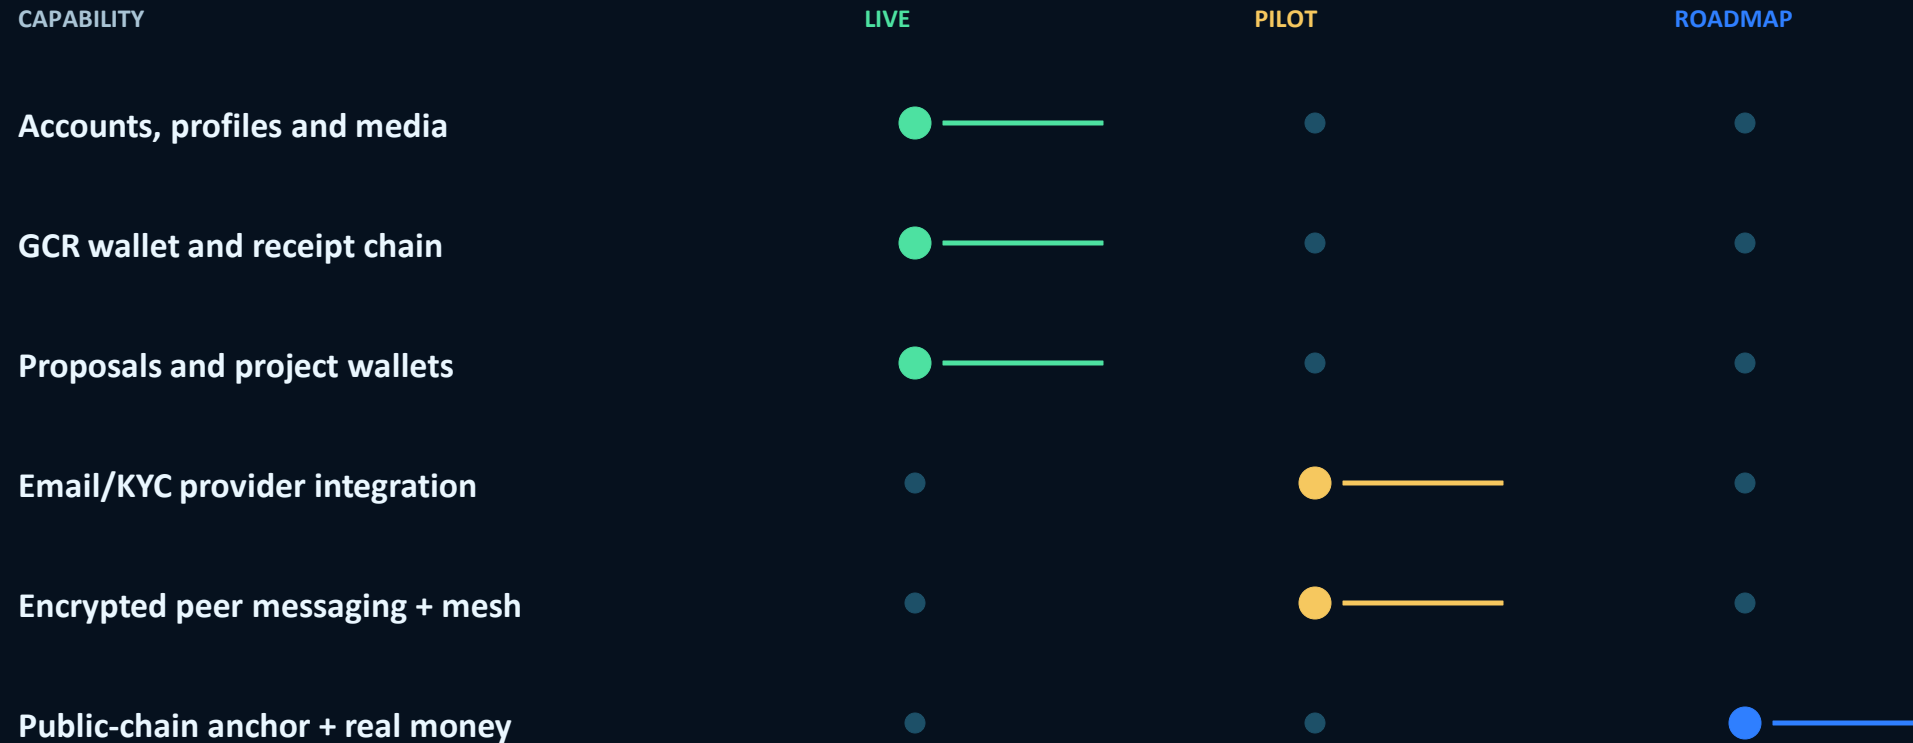

Pilot only after real mission review, safety rules and contribution scoring are tested.

The architecture is local-first, shared where coordination requires it.

Cloudflare edge + D1 + object storage now · peer mesh and public anchoring later

Credibility comes from separating live product from ambition.

Start with one community, prove the loop, then copy the institution.

< 24h

time-to-first useful match
target

The business can monetize coordination without selling civic trust.

SERVICE FEES

Optional fee on completed commercial work

ORGANIZATION TOOLS

Verified company and society workspaces

AI ASSISTANCE

Paid advanced JARVIS workflows

PUBLIC-GOOD FUNDING

Grants and mission partnerships

Guardrail

No advertising model that rewards outrage or hides public decisions.

A focused seed round can turn the MVP into a governed pilot.

\$750k–\$1.5m

illustrative 12–18 month seed range

Milestones: audited identity + wallet controls · one measurable community pilot · repeatable society onboarding · Android store-ready build

Build the first network where decisions end in proof.

The MVP is live. The next question is whether one community can complete the loop repeatedly, safely and measurably.
